

the 1990s, the number of people in the world who are under 15 years of age is expected to increase from 1.1 billion to 1.5 billion, and the number of people aged 65 and over is expected to increase from 200 million to 400 million.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's resources. It is important that we find ways to meet this demand without harming the environment.

One way to do this is to use renewable resources. Renewable resources are resources that can be replenished naturally. Examples of renewable resources are solar energy, wind energy, and water.

Another way to do this is to use resources more efficiently. This means using less of a resource when we can. For example, we can turn off the lights when we leave a room, or we can recycle paper and other materials.

There are many other ways to protect the environment and to use resources more sustainably. It is up to us to decide which ways we want to use.

It is important that we all do our part to protect the environment. If we do, we can make sure that there are enough resources for everyone in the future.

Let's all do our part to protect the environment and to use resources more sustainably. We can make a difference!

Thank you for reading this article. I hope you have learned something new about the environment and about how we can protect it.

Yours truly,
