

the 1990s, the number of people in the world who are undernourished has declined from 1.1 billion to 800 million, and the number of people who are malnourished has declined from 1.5 billion to 1 billion.

There are a number of reasons for this decline. One is that the world's population has grown, but the growth has been concentrated in the developing countries, where the population is still growing rapidly. In the developed countries, the population is declining or growing very slowly. This means that the number of people who are undernourished is declining, even though the world's population is still growing.

Another reason for the decline is that the world's food production has increased. In the 1990s, the world's food production increased by 1.5 billion tonnes. This means that there is more food available for the world's population, and this has helped to reduce the number of people who are undernourished.

A third reason for the decline is that the world's food distribution has improved. In the 1990s, the world's food distribution improved, and this has helped to reduce the number of people who are undernourished. This is because more food is now available to the people who need it most.

There are a number of other reasons for the decline, but these are the main ones. The decline in the number of people who are undernourished is a good sign, but it is not enough. We need to continue to work to reduce the number of people who are undernourished, and we need to make sure that everyone has access to the food they need to live a healthy life.

The world's food production is still growing, but it is not growing fast enough to keep up with the world's population. This means that the number of people who are undernourished is still growing, and we need to find ways to increase the world's food production.

One way to increase the world's food production is to use more land for agriculture. This means that we need to find ways to make the land more productive, and we need to make sure that we are using the land in a sustainable way. This is a challenge, but it is one that we must meet if we are to reduce the number of people who are undernourished.
